1. How the Research Engine Works

Core Principle

The engine runs all sources in priority order — lowest number runs first. Each source fills fields that are not yet filled. Once a field is filled by a higher-priority source, lower-priority sources skip that field. Every run is logged with: source used, fields filled, time taken, and cost in USD.

Three Layers

- **Layer 1 — Claude AI:** Instant enrichment from Saudi domain knowledge. No external calls. Fills 8–12 fields in under 2 seconds. Zero per-lead cost.
- **Layer 2 — Web Search:** 8–20 targeted queries across 58 sources in EN + AR. Claude web_search + Gemini MCP grounding for Arabic results.
- **Layer 3 — MCP / API Gap-fill:** Vibe MCP + ZoomInfo + Apollo + other paid sources. Called only for fields still empty after Layers 1 and 2.
