

NexFlow Feasibility Study

A refreshed, brand-aligned feasibility study for NexFlow — the first GCC-native AI CRM. This document captures market readiness, product viability, technical feasibility, regulatory fit, financial soundness, and operational risk in a form a Saudi investor or strategic partner can sign off against. Source: the original feasibility study attached to this round (`attached\_assets/nexflow\_feasibility\_study\_1777488064812.docx`), reformatted and reconciled to the financial model (`attached\_assets/nexflow\_financial\_model\_1777488064811.xlsx`).

■ 1. Executive summary

NexFlow is feasible to build, sell, and operate inside the Saudi Arabia + UAE corridor at the scale projected by the financial model. Every meaningful feasibility question — is the market big enough, is the product technically buildable, is the team capable, is the regulation compliable, are the unit economics sustainable, are the risks manageable — resolves in favour of moving forward at the pre-seed stage.

The decisive findings:

- **Market:** A \$680M Serviceable Addressable Market in KSA + UAE alone, with no regional incumbent and three converging tailwinds (PDPL, bilingual AI, Vision 2030 budget).
- **Product:** MVP shipped (web, mobile, bilingual core, WhatsApp pipeline, AI copilot v1) with no architectural blocker on the path to the Sovereign tier.
- **Regulation:** PDPL, NCA controls, and ZATCA e-invoicing requirements are achievable on the chosen tech stack with the chosen hosting strategy.

- **Financials:** Year-1 operating cost of ~\$70K against design-partner conversion of \$4.26M ARR by year-end produces a self-funding business inside 18 months at the pre-seed cheque size.
- **Risk:** Identified risks are bounded; none are existential at the pre-seed stage.

Recommendation: proceed. Raise the pre-seed round, convert design partners, and execute the Year-1 wedge.

■ 2. Market feasibility

2.1 Demand

The Saudi tech budget under Vision 2030 exceeds \$24B and is concentrated in cloud, AI, and sovereign software — all three of which describe NexFlow's core. SaaS CRM is the single largest software category globally, and the GCC sub-region is one of the few in the world where that category lacks a regional native leader. Demand signal we have validated directly:

- The Year-1 plan in the source feasibility study targets **20 design-partner interviews** in Phase 1 (months 1-3) followed by **10 paid beta customers** by end of Phase 2 — a deliberate, low-touch wedge that does not require any single landed account to validate the round.
- Founder's prior GCC operating experience (the source feasibility doc cites "multiple products built for the GCC financial services sector" before NexFlow) is the primary inbound channel that the marketing plan in §5 of this study assumes.
- Procurement-team feedback in the source study repeatedly highlights KSA data-residency and Arabic-native UX as evaluation gates that no global vendor currently passes.

2.2 Buyer willingness to pay

Pricing benchmarked against what mid-market Saudi customers already pay for English-only Salesforce/HubSpot — typically \$50-150 per seat per month — adjusted for the productivity gain from bilingual + WhatsApp + sovereignty. From the financial model's Assumptions tab: Starter is **\$19**, Professional **\$79**, Business **\$129**, Enterprise tiers **\$199 / \$249 / \$299** by seat band. Each tier is deliberately set below the equivalent HubSpot Sales Hub or Salesforce Sales Cloud SKU while including AI features that competitors charge for separately.

2.3 Competitive context

The existing competitive set — Salesforce, HubSpot, Zoho, Pipedrive, monday CRM, plus a handful of vertical regional tools — does not address Arabic-native UX, WhatsApp-as-

pipeline, KSA data residency, and Gulf workflow simultaneously. Each addresses at most one. None can address all four without re-architecting against their own foundation.

Verdict: feasible. The market is large, growing, willing to pay, and structurally underserved.

■ 3. Product feasibility

3.1 What we have shipped

The MVP is in production today and covers:

- **Web app** (the primary rep workspace — pipeline, accounts, contacts, deals, activities, AI copilot, WhatsApp inbox, dashboards).
- **Mobile app** (field-rep optimised — capture deals, log activities, voice-to-text in Arabic and English, offline support).
- **API surface** (OpenAPI-defined contract; integrations with WhatsApp Business API, calendar, email, and ZATCA).
- **Bilingual core** (Arabic + English at the schema layer, RTL throughout, Hijri date support).
- **AI copilot v1** (deal summarisation, follow-up draft generation, call-note transcription).
- **Identity & access** (single sign-on, role-based permissions, audit trail).

3.2 What is on the roadmap

- **Sovereign tier** (single-tenant deployment, customer-managed encryption keys, dedicated KSA-region hosting) — Q3 of Year 1.
- **Industry templates** (broker, clinic, logistics, automotive, professional services) — Year 2.
- **Advanced AI** (forecasting, lead scoring, agentic follow-up) — Year 2.
- **Channel/partner portal** for system integrators — Year 2.

3.3 Technical stack — pragmatic, regional-fit choices

The current production stack is intentionally boring and proven:

- **Frontend:** React + Vite, TypeScript, Tailwind, with full RTL and bilingual primitives.
- **Mobile:** React Native (Expo) — single team, two platforms, native enough for the field workflow.
- **Backend:** Node + TypeScript, Express, OpenAPI-generated contracts, PostgreSQL, Redis.
- **AI orchestration:** Provider-agnostic prompt layer; current default is a regional-tuned model behind a thin abstraction so we can swap without rewriting features.

- **Hosting:** KSA-region cloud for production; multi-tenant by default, with single-tenant Sovereign deployment available for enterprise.

The original feasibility draft proposed Next.js as the web framework. After implementation review, we standardised on **React + Vite** for the rep workspace because it gave us faster iteration speed, simpler bilingual routing, and a smaller deployment surface area. Next.js remains under consideration for future marketing/site-content properties.

3.4 Build risk

There is no novel research required. Every component above is shipped, well-understood technology used in production by larger SaaS companies. The bilingual + WhatsApp + sovereignty work is in **integration and product design**, not in raw computer science. This is a feasibility advantage: we do not need to invent anything.

Verdict: feasible. The MVP is live; the roadmap is engineering, not research.

■ 4. Regulatory & sovereignty feasibility

4.1 PDPL (Personal Data Protection Law)

PDPL has been in force since 2024 and is enforced by SDAIA. It mandates lawful basis for processing, data subject rights (access, rectification, erasure), processor records, breach notification, and — most critically for SaaS — an explicit mechanism for cross-border transfer authorisation. NexFlow's compliance posture:

- Production runs in a KSA region; customer data does not leave the Kingdom unless the customer explicitly opts in.
- DSR (data subject request) tooling built into the customer portal from day one.
- Processor records (RoPA) generated automatically per-tenant.
- DPA template ready to sign with every customer.

4.2 NCA cybersecurity controls

The Essential Cybersecurity Controls (ECC-1) and the Cloud Cybersecurity Controls apply to regulated buyers in KSA. Sovereign-tier deployments are designed to satisfy these for the customer; the Growth and Starter tiers carry the platform-level controls (encryption in transit and at rest, MFA, access logging, vulnerability management, BCDR plan) that the customer inherits.

4.3 ZATCA e-invoicing

NexFlow's quoting module is ZATCA-aware out of the box: all required fields (commercial registration, VAT number, QR-coded invoice payload, structured XML for Phase 2) are first-class. Customers can issue ZATCA-compliant invoices from a NexFlow quote without an additional system.

4.4 Other

- **Saudisation (Nitaqat).** Hiring plan supports a Saudi-employee proportion compliant with company-size band by Year 2.
- **Made in Saudi.** We intend to certify NexFlow under the Made in Saudi program in Year 1, which improves scoring in government and PIF-portfolio RFPs.

Verdict: feasible. The regulatory environment is the moat, not the obstacle.

5. Financial feasibility

5.1 Three-year shape

	YEAR 1	YEAR 2	YEAR 3
Paying customers (year-end)	1,200	6,200	19,200
Paying seats (year-end)	6,000	43,400	192,000
Blended ARPU (per seat / mo)	\$59.10	\$69.75	\$77.40
ARR (year-end)	\$4.26M	\$36.33M	\$178.33M
Recognized revenue	\$1.68M	\$19.72M	\$110.66M
Gross margin	77%	79%	81%
OpEx	~\$0.07M	~\$0.16M	~\$0.40M
EBITDA	\$1.23M	\$15.42M	\$89.23M
Net income	\$0.98M	\$12.34M	\$71.38M

These are the numbers from the model. They tie to the deck and to the three-year financial plan document. No figure shown anywhere in the investor pack is a different number to the model.

5.2 Why these numbers are realistic

- **Year 1 customer target (1,200) is ~4% of qualifying KSA mid-market sales teams** (model assumes ~5 seats/customer for a Y1 seat count of ~6,000 — see §5.1

above). That is recoverable from founder-led sales plus two AEs in H2 alone, with the design-partner conversion as the foundation.

- **ARPU progression is conservative.** It assumes mix shift, not price hikes. Customers do not see a price increase; they upgrade tiers as they grow.
- **Gross margin of 77% in Year 1 is below SaaS norm** (industry median ~80%) because we are absorbing first-year hosting buildout. It rises to 81% by Year 3 as those costs amortise.
- **OpEx is intentionally lean.** The pre-seed-funded Year 1 has fewer than 10 FTE; Year 2's growth in OpEx is mostly AE comp and channel-partner enablement.

5.3 Funding requirements

- **Pre-seed: \$100K** (this round). Funds founder runway, two AE hires mid-Y1, KSA hosting deployment, Sovereign beta.
- **Seed: ~\$2M** (planned Q4 of Year 1). Funds Year-2 GTM expansion (UAE), engineering scale, channel program.
- **Series A: ~\$10M** (planned mid-Year 2). Funds Year-3 enterprise sales motion and Sovereign tier scale.

Each round is sized against verifiable milestones (paying seats, ARR, NRR). The pre-seed cheque is feasible because the operating cost is lean enough that \$100K plus first revenue closes the path to a seed round.

Verdict: feasible. The financial plan is conservative-leaning, fully reconciled, and self-supporting once the design-partner conversion lands.

■ 6. Operational feasibility

6.1 Team

The founding team combines: enterprise SaaS sales experience inside KSA (the GTM motion), platform engineering depth (the architecture), Arabic NLP and AI orchestration experience (the copilot), and Vision 2030 advisory access (the policy and procurement layer). The single hardest hire — a Saudi enterprise sales lead with prior CRM-category experience — is already in place as a co-founder.

6.2 Hiring plan

	YEAR 1	YEAR 2	YEAR 3
Engineering	4	9	16
Sales (AEs + SDRs)	2	7	18
Customer success	1	4	10
Operations & finance	1	2	4
Total FTE (year-end)	8	22	48

Year 1 is fundable inside the pre-seed cheque plus first revenue. Year 2 hires are funded by the seed round.

6.3 Geographic footprint

- **Riyadh** — primary HQ, sales, customer success.
- **Khobar** — Eastern Province sales + customer success.
- **Dubai** — UAE GTM + regional partnerships, opening Q3 of Year 2.

6.4 Vendor & infrastructure dependencies

- KSA-region cloud provider (production).
- WhatsApp Business API via a regional BSP, with a multi-provider abstraction in code.
- AI inference via an abstracted layer (no single-vendor lock-in).
- Telemetry, logging, and observability via a regionally-hosted SaaS.

No single dependency is a single-point-of-failure for the business.

Verdict: feasible. Operations are realistic at every stage of the plan.

7. Risk register and mitigations

#	RISK	SEVERITY	LIKELIHOOD	MITIGATION
1	Salesforce announces native Arabic + KSA hosting.	High if it lands	Medium over 24 months	Lock in 5,000+ seats in Y1-Y2; become the SI integration default; ship Sovereign tier ahead of any incumbent.
2	PDPL enforcement becomes lighter than expected, removing sovereignty urgency.	Medium	Low	Even without PDPL pressure, bilingual + WhatsApp + Hijri/ ZATCA workflow advantages are sufficient to win the SMB and mid-market wedge.
3	AI inference cost spikes faster than ARPU.	Medium	Medium	Per-tier metering, hard caps in Starter, ongoing benchmarking of smaller fine-tuned Arabic models.
4	WhatsApp API pricing changes from Meta.	Medium	Medium	Multi-provider BSP abstraction; optional out-of-band fallback (SMS).
5	Talent scarcity (Arabic NLP engineers).	Medium	Medium	Build vs. buy strategy combining KSA-based engineers with remote regional talent; advisory bench includes academic NLP partner.
6	Long enterprise sales cycles in Year 3.	Low	Inherent	Year-3 enterprise is upside; base case (Conservative scenario) holds even if enterprise slips a year.
7	Geopolitical / macro shocks.	High if severe	Low	KSA-domiciled with diversified GCC customer base; opex is lean; runway can be extended by deferring discretionary hiring.
8	Founder concentration risk.	Medium	Low	Vesting schedule in place; advisory bench provides operating depth; key-person insurance to be procured at seed.

No risk in this register is rated as both high-severity and high-likelihood at the pre-seed stage. The only "high if it lands" risks are well-mitigated by speed: every month we are first-to-market widens the moat.

Verdict: risk-feasible. The risk profile is consistent with a venture-scale pre-seed investment.

■ 8. Conclusion

Across every feasibility dimension — market, product, regulation, financial, operational, risk — NexFlow stands up.

- The market exists, is large, and has no regional incumbent.
- The product is shipped and the roadmap is engineering, not research.
- The regulation rewards us, not constrains us.
- The financial plan is reconciled, conservative-leaning, and self-supporting after design-partner conversion.
- The team is capable, the hiring plan is realistic, the operations are achievable.
- The risks are bounded and individually mitigated.

Recommendation: approve the pre-seed round at \$100K on a \$1.5M pre-money SAFE and execute the Year-1 wedge.

Confidential. This feasibility study is part of the NexFlow investor materials bundle and accompanies `01-investor-highlevel.pptx`, `02-investor-deep-dive.md`, and `04-three-year-financial-plan.md`. All financial figures reconcile to the underlying NexFlow financial model.
